

IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A shaving apparatus with a housing, said housing having a passage that is bounded by a housing edge and said housing containing a motor and a driving means drivable by the motor, and with at least one short-hair cutting device projecting out of the housing through the passage and comprising a short-hair cutting tool drivable by the motor and the driving means, and with a long-hair cutting device projecting out of the housing through the passage and comprising a first long-hair cutting tool which is not drivable by the motor and the driving means and a second long-hair cutting tool drivable by the motor and the driving means and located between the first long-hair cutting tool and the short-hair cutting tool, and with a carrying device which carries both the short-hair cutting device and the long-hair cutting device and is

provided for combined adjustment of the short-hair cutting device and the long-hair cutting device and being movable parallel to an adjustment direction between a first operating position and a second operating position such that both the short-hair cutting device and the long-hair cutting device, with the carrying device located in its second operating position, project farther out of housing than when the carrying device is located in its first operating position, wherein both with the carrying device located in its first operating position and with the carrying device located in its second operating position, both the drivable short-hair cutting tool of the short-hair cutting and the drivable second long-hair cutting tool of the long-hair cutting device are drivable by the motor and the driving means, wherein moving the carrying device between the first operating position and the second operating position alters cutting characteristics of the long-hair cutting device while cutting characteristics of the at least one short-hair cutting device remain substantially unchanged.

2. (Previously Presented) The shaving apparatus according to claim 1, wherein a long-hair cutting configuration is provided,

which is essentially U-shaped in cross-section and has a long-hair cutting device in each of the areas, of the free ends of its legs, wherein a short-hair cutting device is provided between the two long-hair cutting devices of the long-hair cutting configuration, and wherein the carrying device is also essentially U-shaped and the long-hair cutting configuration and the short-hair cutting device are inserted into the U-shaped carrying device.

3. (Previously Presented) The shaving apparatus according to claim 1, further comprising a sliding button for adjusting the carrying device, which sliding button is accessible from outside the housing, can slide parallel to the adjustment direction, and is coupled to the carrying device.

4. (Previously Presented) The shaving apparatus of claim 1, further comprising a sliding button for adjusting the carrying device such that the at least one short-hair cutting device and the long-hair cutting device, including the first long-hair cutting tool and the second long-hair cutting tool, can be moved together between the first operating position and the second operating

position while maintaining relative positions between the at least one short-hair cutting device and the long-hair cutting device.

5. (Previously Presented) The shaving apparatus of claim 4, wherein the sliding button has an extension projecting into an interior of the shaving apparatus, said extension projecting into a recess in the carrying device.

Claim 6 (Canceled)

7. (Previously Presented) The shaving apparatus of claim 6, wherein the cutting characteristics of the long-hair cutting device are altered by altering a distance of the long-hair cutting device from the housing.
